

J.F.
The Harel Group
Business Analyst Internship

Having the opportunity to be a part of the Business Analyst Internship Program at The Harel Group has provided me with insightful experiences in how business acquisitions and deals are made between companies. Throughout the duration of the internship, I had the pleasure of working on different projects and assignments pertaining to the new and rapidly growing biomedical device industry. I got real hands on experience into how to search for companies and compile information which would help facilitate potential business transactions with the clients in different markets with specific needs. While majoring in Biomedical Engineering and having insight into the scientific and technical aspects of this industry, it was an awesome experience to see the business operations that allow small companies with great ideas to get the proper funding and find the right collaborators to help get their product to the public.

My time spent working alongside my other intern partner as well as several of the colleagues at The Harel Group allowed me to gain insight into the world of business acquisitions and collaborations. I met on several occasions with Flora who was more than helpful throughout every step of each project. The weekly phone conferences and constant email communication was more than enough to stay on track and keep things progressing in a timely manner. I was happy to know that the work and research I was doing was actually being used by the company and was being brought to the clients by Flora and Jacob themselves. I had the opportunity to meet with Jacob and present some of the work we worked on face-to-face and was proud to be making an impact.

In the end, I am extremely fortunate to have had this opportunity to see how all of the inner workings of this industry take place. I know that my time spent at The Harel Group was meaningful and I will take my experiences here and apply them to my career when I graduate this year. This Internship is really a great learning experience for anyone interested in business or the life science industry.
